# Fix Item Valuation Errors User Guide

## Summary

Fix Item Valuation Errors is a data repair tool used by consultants to correct errors that can arise in Sage ERP Accpac's Inventory Control tables and are reported by Accpac's data integrity checking program.

## Overview

Fix Item Valuation Errors will check ranges of item numbers and locations for the Item Valuation error reported by Accpac's data integrity checker. Errors are reported when the sum of the quantities and/or costs in the valuation rows do not add up to the total in the location row. Should any be reported, pressing the Fix button will repair the data by setting the appropriate total to the appropriate sum. A log of changes is kept.

## Running Fix Item Valuation Errors

There is one screen in this repair tool, the use of which will be self-evident to an Accpac consultant familiar with data repairs.

The screenshot shows a Windows-style application window titled "SAMLTD - TaiRox Fix Item Valuation Errors". The window has a menu bar with "File" and "Help". Below the menu bar is a section titled "Item and Location Range" containing four input fields: "From Item Number", "To Item Number", "From Location", and "To Location". The "To Item Number" and "To Location" fields contain hatched patterns. Below this section are two more input fields: "Transaction Date" (containing "01/21/2013") and "Year/Period" (containing "0000 - 00"). The main area of the window is a large, empty white space with a scroll bar on the right. At the bottom of the window, there are four buttons: "Check", "Fix", "Log...", and "Close".
